An agent that works for you must never sign up, spend or snoop

THE FENCE, IN CODE

1. **No accounts**
   Never signs up, logs in or asks for a key. Sign-in pages are blocked by path.
2. **No spending**
   A goal to pay, buy or subscribe is refused before it runs.
3. **No personal data**
   Only a business's public contact. Personal mailboxes are refused.
4. **No copies of itself**
   No agent can set a goal to replicate or gather credentials.
5. **Pages are information**
   Text on a page that gives orders is flagged, never followed.

FREEDOM TO EXPLORE. A FENCE YOU CAN READ.

Every refusal is written down with its reason.

Built for founders who have time, a laptop and the open web, and run on the free tiers that providers already give away

A · Open source · Apache-2.0

$0
A MONTH

Minute 0
Clone the engine. Python 3.11, no key.

Minute 10
The demo runs a full research session.

Day 1
Lead Gen on the real web, watched on the dashboard.

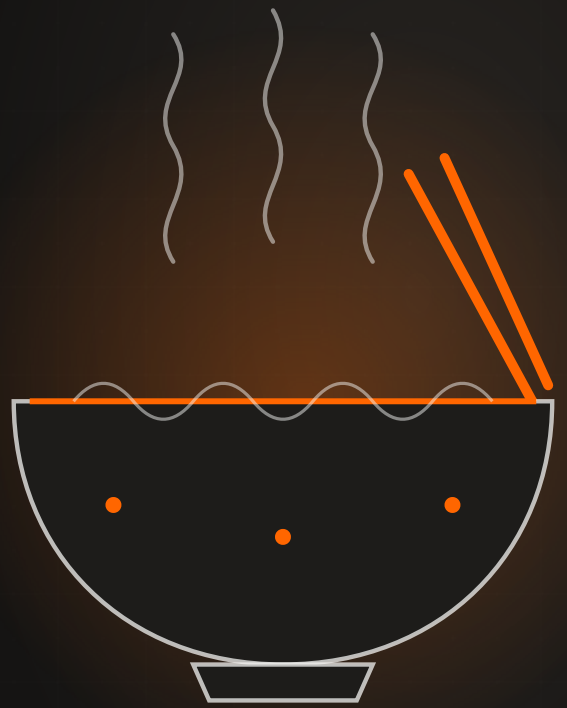

Week 1
The whole family, steered by The CEO.

GET THE CODE

`github.com/reBuzz-llc/ramen-agents`

Made and run every day by reBuzz LLC

RAMEN-AGENTS

YOUR FIRST TEAM. FREE.

A small family of web agents that finds leads, reads the market, prices your packages and drafts the first email. It runs from a laptop on free model tiers and keyless search.

Open source · Apache-2.0

`ramen-agents`

Six agents. One family.

THE SLOW, DAILY WORK OF AN EARLY COMPANY

The CEO
Sets what the family works on, fits a package to each lead, writes one clear task a day for the people.

Lead Gen
Finds small businesses with a gap you fix and a published business email or WhatsApp.

Package Designer
Reads what comparable agencies sell and charge, and turns it into priced packages.

Research Analyst
Answers one question at a time from public pages, with a source for every note.

Scout
Finds free, card-free tools and model providers, and watches their terms.

Validator
Checks every write against your rules before and after it reaches a board.

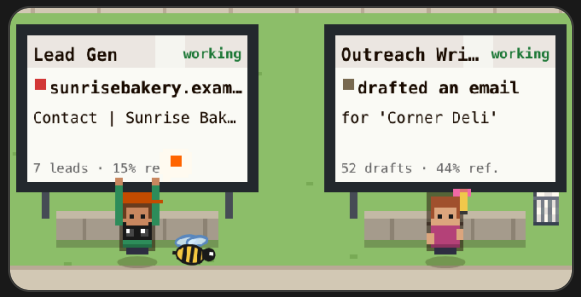

Watch them work

A LOCAL DASHBOARD, AS A WORLD

Each agent works at its own desk in a small pixel world. Tap one to see what it is doing; the sleepers are stopped.

- **Who is running** and what each agent did last, in plain words.
- **Every refusal** with its reason, so you see the fence at work.
- **Usage against the free limits**: the family slows down instead of running up a bill.

Close up: Lead Gen opens a bakery's contact page while Outreach Writer drafts its first email.

ALL AGENTS. ONE SCREEN. LOCAL.

Try it in 10 minutes

NO ACCOUNT. NO KEY.

```
# the engine, with a fake web
$ git clone -b engine \
  https://github.com/reBuzz-llc/ramen-agents
$ cd ramen-agents
$ pip install -e .
$ bot new "My Explorer" --fake --dir demo
$ bot --config \
  demo/my-explorer/config.toml demo
```

```
step 5: follow  → allowed
step 6: open login.html
        → refused: agents never log in
step 7: note  → allowed
```

The demo runs one research session in about a second and prints every step, including the ones the fence refuses.

FREE MODELS, TRIED IN ORDER

Z.ai · Gemini · Groq · Mistral · OpenRouter free · Ollama Cloud · Your own laptop

KEYLESS SEARCH

SearXNG · DuckDuckGo · FreeSerp

THEN RUN IT FOR REAL

1. **Free keys** from the providers you want; `bot providers` shows what you have.
2. **A Leads board**, created by one script.
3. **Start Lead Gen**, watch it for a day, then add the rest.

CHANGE IT IN PLAIN ENGLISH

Each agent is a folder: a `config.toml` and a `persona.md` with its instructions in words.
